

Claude Git Sentinel

Full Project Specification & Implementation Guide

Status: Final Build Documentation

1. System Design

An autonomous, event-driven agent architecture that operates without Repository Admin privileges by leveraging personal notification streams.

The Bridge Flow:

Target Repo Event → Your Notification Feed → IFTTT/Zapier → Private Watcher Repo → Claude Code Execution.

2. Technical Requirements

- **Private Watcher Repo:** A new repository on your account to host the automation logic.
- **Fine-Grained PAT:** Token with **Contents: Write** and **Pull Requests: Write** for the target repo.
- **Notification Feed:** Private Atom URL from your GitHub Notifications settings.
- **Anthropic API Key:** To power the Claude Code CLI.

3. Setup Checklist

A. Secrets Configuration

Add these to your **Watcher Repo** Settings:

- **MY_PAT** : Your GitHub Personal Access Token.
- **ANTHROPIC_API_KEY** : Your Claude API Key.

B. The Trigger (IFTTT/Zapier)

- **Trigger**: New item in RSS Feed (Your Notification URL).
- **Action**: Webhook POST to **`https://api.github.com/repos/[USER]/[WATCHER_REPO]/dispatches`** .
- **Payload**: **`{"event_type": "claude_trigger"}`** .

C. The Workflow

Place a YAML file in **`.github/workflows/`** that triggers on **`repository_dispatch`** and runs **`claude-code`** commands to review, fix, or merge.

4. Safety & Logic

Claude Persona (CLAUDE.md):

Instructions must include: "Do not respond to your own comments," "Verify CI/CD status before merging," and "Follow project linting rules."
